

Lake Erie Harmful Algal Bloom Forecast

2024-09-13

Summary

The cyanobacteria bloom in western Lake Erie has an approximate area of 380 square miles, which is an increase in area since Sep 12. The *Microcystis* bloom extends from Stony Point, MI to Catawba Island, OH. Low concentrations of cyanobacteria are also observed from Catawba Island, OH towards Lorain, OH. Sandusky Bay has a local bloom of mixed cyanobacteria. Toxins have been detected above the recreational limit. They can be highly concentrated in scums! If you see scum, keep your pets and yourself out of the water. In the satellite imagery or bloom forecast position products, any areas that are orange or red are likely to have scum, especially during calm winds, see Mixing Forecast product. --NCCOS HAB Forecasting Team 09 September 2024.

The past few days of imagery can be seen at [the HAB monitoring site](#). The Lake Erie Forecast is operated by the National Centers for Coastal Ocean Science. Contact hab@noaa.gov for technical Questions. Last Updated: 2024-09-13 09 PM EST

Current Lake Erie Sentinel-3 satellite imagery from the Ocean and Land Color Imager (OLCI) on Sep 13, 2024, showing bloom location and extent in the western basin. Grey indicates clouds or missing data. The estimated threshold of cyanobacteria detection is 20,000 cells/mL. Inset shows a truecolor image of the entire lake. Data derived from Copernicus Sentinel-3.

Wind speed and direction from South Bass Is, OH. Blooms mix through water column at wind speeds > 15 knots.

Lake Erie Harmful Algal Bloom Forecast

2024-09-13

Forecast surface bloom position for Sep 14, modeled from the last satellite image with water currents estimated from the Lake Erie Operational Forecast System (LEOFS). Potential for bloom movement is forecast in 3-dimensions with a hydrodynamic model using satellite imagery and currents. The modeled output does not contain clouds. Black indicates the absence of chlorophyll and gray indicates area with no data. The arrows show forecasted currents. Water temperature and winds (in magenta) are the averages for the western basin from the model.

Forecast surface bloom position for Sep 18. Black indicates the absence of chlorophyll and gray indicates area with no data. The arrows show forecasted currents. Water temperature and winds (in magenta) are the averages for the western basin from the model.
